TITLE: Cases of occupational Q-fever in the Jihlava district

SOURCE: Ceskoslovenska epidemiologie, mikrobiologie, imunologie, v. 14, no. 5, 1965, 296-300

TOPIC TAGS: epidemiology, experiment animal, Q fever, blood serum, microbiology, rickettsial disease

ABSTRACT: The article reports on two epidemics of Q-fever of occupational origin in the Jihlava district where it had hitherto been unknown. The first cases in that district were diagnosed in 1961 when five (5) workers in an enterprise processing sheep skins, all of whom had been working with the sheep skins fourteen (14) days before the first clinical signs of the fever, fell ill. Blood samples of the hospitalized patients suspected of Q-fever were sent to the infekční oddělení (Department of Infectious Diseases) of OUNZ in Jihlava, and samples of the wool being processed at the plant (wool from the USSR, Afganistan and eastern Slovakia) were selected for study to determine which types of wool were infected. In both epidemics the diagnoses

1/2

we were able to demonstrate. Contamination of the wool by Coxiella burnetii by attempts to infect guinea pigs with it demonstrated. The wool samples had been taken one month after the outbreaks and need not have contained Coxiella burnetii. Measures are recommended for the prevention of similar epidemics by disinfecting the wool before it is handled.

TITLE: Sight on the Theodolite Telescope ¹²⁶ for Observing the Sun ¹²⁷ in
Azimuth Determination

PERIODICAL: Geodeziya i kartografiya, 1960, No. 6, pp. 48 - 51

TEXT: In 1941, V. V. Kavrayskiy (Ref., Footnote on p. 48) suggested a new method of sun sighting. It was based on the coincidence of the cross wires with the intersecting (or contact) points of the four sun pictures formed by a special prism sight in the field of view of the telescope (Fig. 1). V. V. Kavrayskiy studied such a sight theoretically and made a model of it (Fig. 2). In 1949, an experimental type was made according to this model by the sluzhba vremeni (Time Service) of the TsNIIGAIK. It proved to be complicated in production and inconvenient in operation. In 1957, V. V. Kavrayskiy's scheme was realized in a better construction by F. D. Rabinovich. This sight is briefly described and the test results of the experimental type made in 1957 are given. Figs. 3 and 4 show sectional drawings of this sight, as well as the sight mounted on the theodolite. ✓ B

ol. 421, 19/04, no. 99399, April 15, 1961)

TEXT: The devices used for determining the dew point of combustion prod-
ucts by means of Pt-PtRh thermocouple, fused into a glass cap, give an error
reaching 25%. It is suggested to use the cap 1 (see Fig.) electroplated with an-
other metal 2. Both metals make up a thermocouple. The wires 3 and 4 are com-
pensating. The cooling air is supplied through the tube 5 to produce tempera-
ture drop. When the Cu-Const thermocouple is used the indication error is below
5%. There is 1 figure.

TITLE :An Indirect Chelatometric Method for the Determination Sulfur Dioxide in Food Products

ORIG. PUB. :Prumysl Potravin, 9, No 11, 593-595 (1958)

ABSTRACT The proposed method consists in the distillation of the SO_2 from the product under analysis into a titrated $BaCl_2$ solution containing H_2O_2 , followed by separation of the $BaSO_4$ by filtration and determination of the excess Ba ions by chelatometric titration in alkaline medium, using the fluorescent indicator 'Fluorekson' (calcein). The authors have shown by comparison tests on the determination of SO_2 in 11 samples of dried fruits, wines, and juices that the proposed method is

"Determination of Glycerine in Some Pharmaceutical Preparations."

Prague, Ceskoslovenska Farmacie, Vol XII, no 7, September 63,
pp 366-368.

Abstract [Authors' English summary, modified]: A method has been suggested for determining glycerine in Jarisch's solution, formaldehyde solution, suspensions, and suppositories. Glycerine is oxidized in a medium of an eighty-percent acetic acid in the presence of potassium acetate by means of an excess of a volumetric solution of lead tetraacetate. The excess of the reagent is then determined by a potentiometric titration with a volumetric solution of hydroquinone. The method is simple and yields more accurate results than the bichromate method. Twelve references, including 7 Czech.

✓ 1001. The chromatographic determination of the
pranum content of Hungarian coal-ash. J.
 Stromtágh, L. Farady and A. János (Univ. Chem.
 Ind. Veszprém, Hungary). *Magyar Kém. Foly.*
 1955, 61 (10), 312-314. — For coal-ash, containing
 40 to 60 per cent. of SiO_2 , the method of Burstall
 and Wells (*Analyst*, 1951, 76, 388) has been used,
 with the following modifications. Whatman ash-
 less paper No. 214 is cut into squares (10 mm x
 10 mm); 10 g of this paper are activated with 5 per
 cent. HNO_3 (5 ml) by heating it to boiling in 3
 min. and then boiling for a further 20 min. The
 pulp is washed successively, by suction, with H_2O
 (till free from NO_3^-), 95 per cent. ethanol (90 ml),
 absolute ethanol (90 ml) and anhydrous ether
 (450 ml). The coal-ash (2 to 3 g, ignited at 900°C)
 is fused in a platinum crucible with eight times its
 wt. of Na_2CO_3 - K_2CO_3 and the residue is taken up
 in conc. HNO_3 and twice evaporated to dryness in
 a platinum dish (the use of porcelain leads to loss

J. Szonntagh

of uranium). The residue is then dissolved in HNO_3 (20 ml), filtered, washed with HNO_3 , evaporated to dryness and taken up in several portions (10 to 20 ml each) of ether- HNO_3 (85:5 by vol.) and transferred to the column, which is then washed with several portions of the solvent (total, 100 ml). The uranium is determined photometrically, by diluting the soln. with an equal vol. of H_2O , distilling off the ether and concentrating the soln. to a small vol. in a platinum dish. Conc. H_2SO_4 (2 to 3 ml) is added and the soln. is heated till fumes of SO_3 appear. To the cooled soln., diluted to ≈ 25 ml and filtered, 10 per cent. $\text{K}_2\text{Fe}(\text{CN})_6$ (5 ml, containing 1 per cent. of Na_2S) is added and the soln. is diluted to 50 ml. After 15 min., the extinction is measured photometrically at 8461 \AA , with a 10-mm cell. The compensating soln. contains Na_2S and $\text{K}_2\text{Fe}(\text{CN})_6$. The calibration curve is prepared with uranyl nitrate. Reproducibility is within ± 15 per cent. A. G. PRTO

PURPOSE: This booklet is intended for geophysicists as well as engineering
and technical personnel in the petroleum industry.

CONTENTS: This collection of articles describes new equipment and instruments
used in the petroleum industry. Individual articles discuss the single-
cable electronic thermometer and the magnetic logging locator. Regional
exploration problems such as electrical sounding at sea, electrical survey
in permafrost areas etc. are also treated. References accompany each article.

TITLE: Areal method of tellurogram processing

SOURCE: Moscow. Vses. n-i. inst. geofiz. metod. razv. Razvedoch. i promyshl. geofiz., no. 50, 1963, 67-69

TOPIC TAGS: areal method, tellurogram, recording channel, synchronization, vectorial diagram, areal section, component, coordinate axis, planimeter

ABSTRACT: A new method for processing tellurograms, called the areal method, is described. The processing of tellurograms by this method consists of the following operations: 1) the determination of the constants of the recording channels, 2) the synchronization of tellurograms and determination of areas, 3) the drawing of vectorial diagrams, and 4) the determination of the parameter μ . Areas on field and basic tellurograms are determined from synchronic areal sections

Card 1/2

ACCESSION NR: AT4032735

and the components related to coordinate axes are measured by planimeter. Auxiliary values S_x , S_y , S_u , and S_v are determined from the measured components, the constants of the recording channels, and the lengths of synchronic sections on the basic and field tellurograms. The auxiliary values are plotted on coordinate axes, and the vectorial areas are determined with the aid of these values. The parameter μ is a ratio of the field vectorial area to the basic area. This method simplifies the processing of tellurograms. Orig. art. has: 2 figures and 4 formulas.

AUTHORS: Khanlarova, A. G., Melik-zade, M. M., Faradzhev, Kh. F.,
Subkhanverdikhanova, V. V.

TITLE: Study of the effect of the nature of the oil medium upon the
formation of a protective film by the tagged admixtures
A₃HMM-7 (AzNII-7) and ЦНАТММ-339 (TsIATIM-339)

PERIODICAL: Referativnyy zhurnal. Khimiya, no. 13, 1961, 526, abstract
13M302 (Azerb. neft. kh-vo, 1960, no. 7, 34 - 36)

TEXT: The authors studied the formation of anticorrosion films (protective
films) on lead bronze under the action of 3% oil solutions of A₃HMM-7
(AzNII-7) and ЦНАТММ-339 (TsIATIM-339) admixtures tagged with radio-
isotopes. The experiments were carried out with a lead bronze - steel
pair at 180°C within 600 min, using a method previously described (RZhKhim.
1960, No. 13, 54355). D-11 (D-11), CY (SU), and MT-16 (MT-16) oils with
different degrees of purity, fractions of hydrocarbons of different
groups, separated from these oils by adsorption on silica gel, as well as
dinonyl benzene and trihexyl benzene were used as oil media. The data

Card 1/2

Study of the effect...

S/081/61/000/013/017/028
B110/B205

presented illustrate the great effect of the chemical nature of the oil medium on the formation of anticorrosion films and on the corrosive wear of the metal. Above all, the data indicate that in naphthene-paraffin fractions and oils the protective film formed is larger and wear is lower than in aromatic hydrocarbon fractions and in pure aromatics. TITLE: Tagged atoms in the investigation of the anticorrosion effect of the AzNII-7 (AzNII-7) additive

PERIODICAL: Referativnyy zhurnal, Mashinostroyeniye, no. 8, 1961, 107, abstract 8B803 ("Azerb. neft. kh-vo", 1960, no. 10, 40 - 41)

TEXT: With the aid of the tagged atoms C^{14} and C^{45} the authors studied the anticorrosion effect of the AzNII-7 additive to diesel oil in a lead bronze-steel friction couple. It is shown that the mentioned additive is a corrosion inhibitor. The phenol ring and the metal of the multifunctional AzNII-7 additive participate in the formation of an anti-corrosion film on the lead bronze. The test results are compiled in 2 tables.
